

Anatoly T. Fomenko

History: Fiction or Science?

Ask a scholar of natural sciences – some of them might surprise you, and more than you think. The present book, however, is a whole lot more than just another shot fired in the timeless battle between natural sciences and humanities; it takes everything you ever knew about history, and turns it into a pile of smoking rubble. This explosive knowledge is presented in a very level-headed and academic manner. The sheer amount that Anatoly T. Fomenko and his colleagues cite for evidence suffices for making one quite certain of their veracity before very long, no matter how sceptical the initial attitude was, unless the accumulated dogma rendered you unable to perceive anything quite as disturbingly radical as the work in question.

What is so specific about these theories, then, and what should make this material revolutionary? First and foremost, prepare to find documented human history to be a millennium old at best. Mind you, quoting antediluvian datings of papyrus documents or cuneiform tablets as counter-argumentation has already been tried; the thing is, these datings are by no means irrefutable. They are invariably linked to the consensual chronological scale, and it is this very scale that the authors deconstruct so artfully. Fomenko and team go far enough to prove that no dating methods are truly independent, be it radio-carbon analysis, dendrochronology, or anything else. What do they offer as an alternative?

Facts, mostly. The main methods are empirico-statistical, and involve extensive calculations. The data used are collected from a great variety of sources (chronicles, dynastic tables etc), and studied meticulously. Reign durations of various dynasties are compared with each other in search of duplicates. Every ancient eclipse is given a new precise dating that fits its astronomical parameters perfectly as opposed to the one offered by the consensual version. Nearly every event considered “ancient” nowadays proves mediaeval after careful examination. *Jesus Christ, impossible as it might sound, was born in 1053 AD and crucified in 1086 AD.*

This book is a must read for everyone who isn't entirely indifferent to human history, and possibly also for those who are – seeing the agglomeration of numerous bulky dynasties and cyclic imperial epochs dissolve into something linear, short, and densely packed with events, as well as logical, making a lot more sense than the official version, might do just that to one. Basically, one can say that it is the first serious attempt to finally transform history into a science – from a profession, and a sinecure at that.
